

KSE 100 KSE 100 Index

PSX · DAILY

Close · Tue 29 Sep 2026: **169600.40** · **-0.48%** vs prior session (2026-09-28) · a fifth test of the same trendline support the analyst has been tracking since the index's climb began.

THE SETUP

The analyst frames the index at its fifth test of the same support zone: KSE-100 is currently trading above the **169,600** support level, which the analyst identifies as also representing trendline support, an area the index has previously bounced from on four occasions. The chart poses the question this test asks: if the index sustains the **169,600** support, the analyst sees it moving toward **172,700**, followed by the next target of **175,800**. However, if the **169,600** support fails to hold, the analyst identifies the next support at **165,800**.

LEVELS IN FOCUS

Second overhead level	175,800
The further structural level the analyst identifies if support holds	
First overhead level	172,700
The nearest structural level the analyst is watching if the current support holds	
Support currently in play	at the close
The level the analyst notes price is trading above, at the fifth test of this trendline support	
Next support below	165,800
The level the analyst identifies if 169,600 fails to hold	

WHAT TECHNICIANS WATCH FROM HERE

- ▶ **169,600 is the support the analyst is watching:** whether the index sustains a close above it, on this fifth test, or slips through, is the next signal.
- ▶ **172,700 is the first overhead level the analyst identifies:** it becomes relevant if the current support continues to hold.
- ▶ **175,800 is the further target the analyst identifies:** a level to watch beyond 172,700 if momentum carries through.
- ▶ **165,800 is the next support the analyst sees:** relevant if 169,600 does not hold on this test.

GENERAL CONCEPT · EDUCATION, NOT A VIEW ON THIS STOCK**KSE-100 at Critical 169,600 Support: Bounce or Breakdown?**

When a support level is tested and holds multiple times, technicians pay close attention to how many times price has approached that same zone without breaking through. Each successful bounce adds to the level's perceived significance, because it shows that buyers have repeatedly stepped in at roughly the same price area. However, this repetition also raises a natural question: a level that has held several times does not hold indefinitely, and each additional test can be viewed either as reinforcing the floor or as gradually testing its durability. The way analysts typically read this is symmetrically: a continued hold, confirmed by price sustaining above the level rather than just touching it, supports the idea that the zone remains valid, while a decisive break through it suggests the structure has shifted and the next lower reference point becomes the relevant one to watch. Trendline support in particular is drawn by connecting a series of higher lows, and its relevance depends on price continuing to respect that rising line over time.
