

KSE 100 KSE 100 Index

PSX · DAILY

Close · Mon 5 Oct 2026: **165867.31** · **-1.36%** vs prior session (2026-10-02) · the index's reaction at the key support level is what the analyst is watching for near-term direction.

THE SETUP

The KSE-100 Index is approaching a level the analyst identifies as key support at **164,900**. The chart poses a straightforward question: does the index sustain above this level and take support there, opening the path toward a recovery the analyst sees extending to **170,000**, or does it register a decisive break below **164,900**, in which case the analyst points to the next support level around **157,000**. The analyst frames the index's reaction at **164,900** as the crucial pivot for near-term direction.

LEVELS IN FOCUS

Recovery level	170,000
The level the analyst identifies as the recovery objective if support at 164,900 holds	
Current test point	at the line
Where the index is currently testing the key support level the analyst is watching	
Key support level	164,900
The support the analyst identifies as crucial for near-term direction	
Next support level	157,000
The further support the analyst identifies if 164,900 gives way	

WHAT TECHNICIANS WATCH FROM HERE

- ▶ **164,900 is the key support level the analyst is watching:** whether the index sustains above it on a close, rather than briefly dipping through, is the central signal for the next session.
- ▶ **170,000 is the recovery level the analyst identifies:** it becomes a relevant reference if the index holds above 164,900 and momentum builds.
- ▶ **157,000 is the next support level the analyst identifies:** it becomes relevant only if 164,900 is decisively broken, according to the analyst's read.
- ▶ **A decisive break below 164,900** is what the analyst frames as the trigger for further downside: how the index behaves around that line, rather than a single touch, is what the setup asks for next.

GENERAL CONCEPT · EDUCATION, NOT A VIEW ON THIS STOCK**164,900 in Focus: Rebound or Further Downside?**

A key support level is a price area where buying interest has previously been strong enough to halt or reverse a decline, and technicians watch how price behaves when that area is retested. The core idea is that a level gains significance the more times the market reacts to it: if price approaches the zone and stabilizes or bounces, it reinforces the level as a floor; if price instead pushes through it with conviction, the level is said to give way, and the market often looks to the next such zone below. The phrase 'decisive break' is used to distinguish a brief, low-conviction dip through a level from a sustained move past it, since a single wick or intraday poke below a support line does not carry the same weight as a close that holds below it. This is why technicians often wait for confirmation, rather than reacting to the first touch, before concluding that the structure has shifted. The broader principle is that support and resistance levels are reference points for probability, not guarantees, and the market's reaction at these zones is what informs the next read on direction.
