

KSE 100 KSE 100 Index

PSX · DAILY

Close · Mon 12 Oct 2026: **165124.41** · **-1.18%** vs prior session (2026-10-09) · The KSE-100 sits near a key support inside a Falling Wedge, with the analyst watching how price behaves around it.

THE SETUP

The analyst describes the KSE-100 Index as forming a Falling Wedge, a pattern the analyst notes may signal a potential reversal. Price is trading near the key support level of **165,100**, which the analyst flags as important to watch in the coming sessions. The chart poses one question: does the index respect that support and show signs of recovery, opening room toward the overhead level of **169,000** that the analyst identifies, or does it break down below the pattern. In the analyst's read, a breakdown below the pattern would weaken the near-term technical outlook, and the next support level visible sits at **160,550**. The analyst's focus is price action around the current support zone.

LEVELS IN FOCUS

Overhead level	169,000
The level the analyst identifies above if a recovery from support develops, a level to watch, not a forecast	
Current price	at the support
Price is trading near the key support the analyst is watching	
Key support	165,100
The key support level the analyst flags as important to watch in the coming sessions	

WHAT TECHNICIANS WATCH FROM HERE

- ▶ **165,100 is the key support the analyst is watching:** whether price respects it and shows signs of recovery, rather than slipping through, is the first signal.
- ▶ **169,000 is the overhead level the analyst identifies:** it becomes relevant as a reference point only if recovery develops from the support zone.
- ▶ **A breakdown below the Falling Wedge** is the condition the analyst says would weaken the near-term technical outlook and shift attention to the next support.

LEVELS IN FOCUS (CONT.)**Next support**

The next support level the analyst sees if the index breaks down below the pattern

160,550**WHAT TECHNICIANS WATCH FROM HERE (CONT.)**

- ▶ 160,550 is the next support level the analyst sees: it comes into view only if price fails to respect the current support zone.

GENERAL CONCEPT · EDUCATION, NOT A VIEW ON THIS STOCK**KSE-100 at a Crucial Support: Falling Wedge Signals Potential Reversal**

A Falling Wedge is a chart pattern where price makes lower highs and lower lows, but the two boundary lines drawn along those swings slope downward and move closer together. The narrowing shows that each push lower is covering less ground, which technicians read as selling pressure gradually losing strength. That is why the pattern is often watched as a possible reversal setup. It is not a guarantee. The pattern only matters once price reacts to its boundaries. A recovery from the lower boundary, followed by a close above the upper boundary, is what technicians treat as confirmation. A close below the lower boundary does the opposite and means the pattern has failed. As with any support area, the useful question is simple: does price respect it, or does it break through.
