

KSE 100

KSE 100 Index

PSX · DAILY

Close · Mon 26 Oct 2026: **163038.46** · **+0.41%** vs prior session (2026-10-23) · Index bounces from support at the level the analyst is watching, with the rebound still to be confirmed.

THE SETUP

The analyst notes that the KSE-100 Index took support at the **161,300** level and staged a bounce-back, which points to the possibility of a short-term recovery. The question the chart poses is whether the rebound is sustained. If buying momentum continues, the analyst sees the index moving toward the next structural level overhead at **166,200**, a level to watch rather than a forecast. The analyst also calls **161,300** the crucial support to watch. If the index fails to stay above it and selling pressure intensifies, the analyst reads the recovery as losing momentum, with the **157,000** level as the next downside reference.

LEVELS IN FOCUS

Overhead level

166,200

The next structural level the analyst identifies if the rebound is sustained and buying momentum continues

Crucial support

161,300

The level where the analyst sees the index taking support and bouncing; the level the analyst calls crucial to watch

Downside reference level

157,000

The level the analyst points to if support fails and selling pressure intensifies, where the recovery read would have lost momentum

WHAT TECHNICIANS WATCH FROM HERE

- ▶ **161,300** is the support the analyst calls crucial: whether the index stays above it on a close is the first signal that the rebound is intact.
- ▶ **166,200** is the next overhead level the analyst identifies: whether buying momentum carries price toward it and through it on a close, rather than touching and fading, is what confirms continued recovery.
- ▶ **157,000** is the downside reference the analyst names: a close below **161,300** with intensifying selling would bring this level into view and the recovery read would lose momentum.

GENERAL CONCEPT · EDUCATION, NOT A VIEW ON THIS STOCK**KSE-100 Rebounds: 166,200 Upside Target, 157,000 Downside Risk**

A support level is an area where buyers have stepped in before and slowed or reversed a decline. When price falls back to that area and bounces, it suggests buyers still treat the zone as meaningful. A bounce alone is only a first step. Technicians look for the rebound to be sustained, meaning price keeps building on the move and closes beyond nearby resistance, which is the next area where sellers have tended to appear. The other side is just as important. If price closes below the support and selling pressure grows, the bounce is read as having failed, and attention shifts to the next lower reference level. The useful habit is to ask the same question each session: does price respect the support, or does it break through. The answer shows whether the rebound is gaining strength or fading.
