KSE 100 KSE 100 Index

PSX · DAILY

Close · Tue 10 Nov 2026: **179335.24** · **+3.13%** vs prior session (2026-11-06) · Falling wedge breakout follows through as the index approaches the minor resistance the analyst is watching.

THE SETUP

The analyst's concept is a falling wedge breakout, a pattern the analyst says was previously identified. The KSE-100 Index has broken out of it and has been following the pattern's bullish implications, which the analyst reads as improving market sentiment and sustained buying interest. The session on Tuesday closed at **179335.24**, against **173886.69** at the prior Friday close, so the index sits higher than where the prior close left it. The index is now approaching the minor resistance the analyst marks at **179,500**. The chart poses one question: does a decisive close above **179,500**, sustained rather than a brief touch, open the way to the next structural level overhead at **185,900**, a level to watch and not a forecast. The alternative the analyst describes is that price fails at that resistance and selling pressure emerges, which would bring the key support at **174,500** back into view. That is the level the analyst is watching on the downside.

LEVELS IN FOCUS

Next overhead level — **185,900**
The next structural level above the minor resistance that the analyst identifies, a level to watch and not a forecast

Minor resistance — **179,500**
The minor resistance the analyst says the index is approaching, where a decisive and sustained breakout is the question

WHAT TECHNICIANS WATCH FROM HERE

- **179,500 is the minor resistance the analyst is watching**: a decisive close above it that is sustained, rather than a touch that fades, is what the analyst describes as paving the way for further upside.
- **185,900 is the next structural level overhead the analyst identifies**: it becomes the relevant reference only if price clears and sustains above 179,500.

LEVELS IN FOCUS (CONT.)

Current position — **Approaching minor resistance**
Price sits just beneath the minor resistance after the falling wedge breakout

Key support — **174,500**
The key support the analyst names if the index fails to overcome the minor resistance and selling pressure emerges

WHAT TECHNICIANS WATCH FROM HERE (CONT.)

- **174,500 is the key support the analyst names**: a failure at resistance followed by a move back toward this area would test whether the support read still holds.
- **How price behaves around 179,500** is the next signal: acceptance above it and a rejection from it point to different outcomes, and the chart will show which one is in play.

GENERAL CONCEPT · EDUCATION, NOT A VIEW ON THIS STOCK

Bullish Momentum Builds: KSE-100 Eyes 185,900 After Falling Wedge Breakout

A falling wedge is a pattern in which price makes lower highs and lower lows, but the two boundary lines slope down and draw closer together. The range narrows as the move lower loses force. Technicians read this as a sign that selling pressure is fading, because each push down achieves less than the one before. The pattern is usually considered resolved when price closes above the upper boundary, which acts as trendline resistance while price is inside the wedge. After a breakout, the market often meets nearby resistance levels, where sellers have stepped in before. A close that stays above such a level, rather than a brief poke through it, is generally seen as stronger evidence that the breakout has real participation behind it. If price fails at that level, it often drifts back toward the nearest support. The pattern does not predict the outcome. It gives you a clear set of levels to watch and a way to tell whether the market is accepting or rejecting the move.
