

KSE 100

KSE 100 Index

PSX · DAILY

Close · Tue 15 Sep 2026: **169392.32** · **+0.85%** vs prior session (2026-09-14) · the index holds its recovery support, with the next move hinging on whether 166,200 sustains or gives way.

THE SETUP

The analyst identifies **166,200** as the level where the KSE-100 Index has taken support, and treats it as the key near-term support for the market. The chart poses a straightforward question from here: does the index sustain above **166,200** and extend the current recovery toward the next upside level the analyst identifies around **174,650**, or does a decisive break below **166,200** weaken the current setup and open the way toward the next support zone the analyst points to around **162,000**. For now, the analyst frames **166,200** as the pivot the market's next directional move hinges on.

LEVELS IN FOCUS

Key level in focus

at the close

The support level the analyst says the index has taken support around, and calls the key level to watch for the market's next directional move

Next upside level

174,650

The next upside level the analyst identifies if the index sustains above the key support

Next support zone

162,000

The next support zone the analyst points to if 166,200 is decisively broken

WHAT TECHNICIANS WATCH FROM HERE

- ▶ **166,200** is the level the analyst is watching most closely: whether the index holds a close above it, rather than dipping through it, is the first signal for the next session.
- ▶ **174,650** is the next upside level the analyst identifies: it becomes a relevant reference if the index sustains above 166,200.
- ▶ **162,000** is the support zone the analyst points to on the downside: it comes into focus only if 166,200 is decisively broken rather than briefly tested.
- ▶ **A decisive break versus a brief dip below 166,200** is the distinction the analyst draws: how the index behaves around that line is what the setup asks for next.

GENERAL CONCEPT · EDUCATION, NOT A VIEW ON THIS STOCK**Bulls Defend 166,200: Recovery Momentum Builds**

A support level is a price area where buying interest has previously stepped in to slow or reverse a decline. When price returns to that area again, technicians watch closely to see whether the same buying interest reappears. The key distinction is between a brief touch and a decisive break: a brief dip below a support level that quickly reverses is generally read differently from a sustained close below it, which suggests the level has stopped acting as a floor. If support holds, the prior structure is considered intact and analysts often look toward the next level above as a reference point for continued movement. If support fails on a decisive basis, attention typically shifts to the next support zone further below, since the level that previously held is no longer expected to do so. This holds/break framework is one of the most basic tools in technical analysis, used to gauge whether an existing trend or recovery is still in force or is starting to weaken.
